

FOR IOS · IPADOS · MACOS · WATCHOS

From Ink.

The marketing kit can do anything CSS allows. This one can't. No Editorial New, no Söhne, no Caveat — only what ships on Apple's platforms. This document is the bridge: how the brand reads on a phone, in a window, inside a Tab Bar, when the system insists.

CONTENTS

A native translation.

The marketing kit lives on the open web — it can typeset in **Editorial New** at 144 pt and lay it on paper-cream. **Inside the apps it can't.** System fonts, system materials, system controls, Apple-supplied modals (EventKit, ShareSheet, Photos picker) all assert themselves. This kit is the translation layer: **what we keep, what we substitute, and what we let the OS own.**

01	Principles	04
02	Type — system stacks	06
03	Color — tokens & Dark Mode	10
04	Materials & elevation	14
05	SF Symbols inventory	16
06	Components — bars, rows, buttons	20
07	Screens — Today, Notebook, Editor	24
08	System surfaces we don't own	30
09	Voice — in-app copy	32
10	Do's & don'ts	34

Native first, brand second.

On Apple's platforms **the OS is part of the design**. A list row, a Done button, a permission sheet — these arrive pre-typeset, pre-tinted, pre-animated. We work with them, not against them.

KEEP

The **off-black ink** and **paper-cream** tokens. Editorial type at marquee moments via **New York**. Mono labels for metadata. The **1 px hairline rule**. The monogram.

SUBSTITUTE

Editorial New → **New York Light**. Söhne → **SF Pro**. IBM Plex Mono → **SF Mono**. Caveat handwriting → omit, or use a user-drawn glyph.

CONCEDE

EventKit, the Photos picker, ShareSheet, system alerts, the Lock Screen complication chrome. **Don't fight them**. Tint and label cleanly so they hand off to our screens.

ANCHOR

Every screen carries at least **one editorial anchor** — a New York date, a serif title row, the monogram in a Tab Bar. That's the brand.

02 — TYPE

Three
system
faces.

Apple ships every face we need. **SF Pro** for UI, **New York** for editorial moments, **SF Mono** for metadata. The marketing brand uses Fraunces, Inter, IBM Plex Mono — these system faces are their closest native equivalents.

We do **not** ship custom fonts. They bloat the binary, break Dynamic Type, and lose to system optical sizing on iPad and watch. **The system stack always wins.**

Type ramp — system roles

ROLE	APPLE STYLE	FACE / SIZE / WEIGHT	USED FOR
Display	– (custom)	New York Light · 48–96 · –2%	Date masthead, app icon, marquee titles
LargeTitle	.largeTitle	SF Pro Bold · 34	Top-level screen titles (collapsed nav)
Title 1	.title	SF Pro Semibold · 28	Section headers in Today / Notebook
Headline	.headline	SF Pro Semibold · 17	List row primary text, sheet titles
Body	.body	SF Pro Regular · 17	Default body, list rows, sheet copy
Editor body	– (custom)	New York Regular · 18/26	Note editor – only place serif body lives
Callout	.callout	SF Pro Regular · 16	Subtitles, contextual paragraphs
Subheadline	.subheadline	SF Pro Regular · 15	Secondary list metadata
Footnote	.footnote	SF Pro Regular · 13	Captions, edited-at, counts
Caption	.caption	SF Pro Regular · 12	Tab Bar labels, dense overlays
Mono label	– (custom)	SF Mono Medium · 11 · +18%	Eyebrows, runners, status strings

All sans roles must respond to Dynamic Type. Use `UIFontMetrics.default.scaledFont(for:)` / SwiftUI's `.font(.body)` so users on AX5 get our type at the same hierarchy. The custom serif/mono roles scale via the same metrics.

Marketing → native — what each face becomes

MARKETING FACE		NATIVE FACE	HOW CLOSE
Fraunces 300	→	New York Light	≈ 95% — same warmth, slightly less optical contrast at display sizes
Inter Regular	→	SF Pro Text Regular	≈ 99% — same neutral grotesque; SF reads tighter at small sizes
IBM Plex Mono	→	SF Mono	≈ 90% — slightly mechanical vs. Plex's warmth; tracked +18% to match
<i>Caveat handwriting</i>	→	— (omit)	No native cursive. Use the user's own handwriting, or replace with serif italic.

Editor body — the only place serif body lives

APP — EDITOR (NEW YORK · 18/26)

The editor is the one place the brand's editorial voice gets to breathe at body weight. Headers in *New York Italic*, body in New York Regular, hairline-ruled margin in SF Mono. Everything else in the app is a chrome around **this**.

— EDITOR FRAME

APP — LIST ROWS (SF PRO · 17)

Everywhere else, body is SF Pro at the system Body size. List rows, sheet copy, settings, search results. **Default to system metrics** unless you're inside the editor.

— UIKIT / SWIFTUI DEFAULT

Ink and paper.

Two colors, both warm. Off-black ink with a faint sepia cast, paper-cream that reads as neutral until you put it next to true white. **Same hexes the apps already ship.**

We stop short of overriding Apple's **semantic colors**. Where the system supplies a color (separators, system grays, alert backgrounds), we let it through and tint with our app tint. The custom tokens below are for surfaces and text we own.

Light — the canonical palette

PAPER / CANVAS	SURFACE	HIGHLIGHT	INK 3	INK 2	INK	RESERVE	TRUE WHITE
#FAF8F8 · LIGHT.canvas	#F0EFE9 · LIGHT.surface	#E8E4D0 · LIGHT.hi	#ACA8A1 · LIGHT.ink3	#5C5852 · LIGHT.ink2	#1F1D1A · LIGHT.ink	#0E0D0B · sparingly	#FFFFFF · system only

The right-most cell is **true white** — included only for contrast. Our paper is warmer and reads as off-cream when stacked next to it. **Never use pure white as a brand surface in-app.**

Dark — mirrored, warmth preserved

PAPER / CANVAS	SURFACE	HIGHLIGHT	INK 3	INK 2	INK	RESERVE	TRUE BLACK
#17171A · DARK.canvas	#242428 · DARK.surface	#2A2A2E · DARK.hi	#5E5B55 · DARK.ink3	#9D9A91 · DARK.ink2	#EDEAE0 · DARK.ink	#FFFFFF · sparingly	#000000 · OLED only

Token map — semantic to app

How our tokens line up with Apple's semantic colors. **Use the app token whenever the surface is ours.** Use the system token whenever the surface ships with the OS (alerts, action sheets, the keyboard, the picker).

APPLE SEMANTIC		APP TOKEN	NOTES
systemBackground	→	paper · #FAFAF8	Default screen background. Slightly warmer than system.
secondarySystemBackground	→	surface · #F0EFE9	Cards, grouped lists, search bars.
systemGroupedBackground	→	surface · #F0EFE9	Inset grouped lists. Surface tone, not white.
label	→	ink · #1F1D1A	All primary text. Maps to label / .primary.
secondaryLabel	→	ink-2 · #5C5852	Captions, mono runners, list metadata.
tertiaryLabel	→	ink-3 · #ACA8A1	Placeholder copy, disabled glyphs.
separator	→	rule (derived from ink @ 18%)	0.5 px hairlines. Use system separator inside system lists.
tintColor (system)	→	ink · #1F1D1A	App tint is ink , not systemBlue. Set window.tintColor globally so all controls inherit.
selection	→	hi · #E8E4D0	Text selection, multi-select highlight.

Asset Catalog naming

Ship colors as named entries in the iOS Asset Catalog with explicit Light / Dark Appearances. **Never hardcode hexes.**

ASSET NAME	LIGHT	DARK	USE
ink/Paper	#FAFAF8	#17171A	primary surface
ink/Surface	#F0EFE9	#242428	grouped lists, cards
ink/Highlight	#E8E4D0	#2A2A2E	selection, hover
ink/Ink	#1F1D1A	#EDEAE0	primary label · app tint
ink/Ink2	#5C5852	#9D9A91	secondary label
ink/Ink3	#ACA8A1	#5E5B55	tertiary label
ink/Rule	#1F1D1A · 18%	#EDEAE0 · 18%	hairline rule

Blur where the OS blurs.

We use system materials for chrome that **floats over content** — Nav Bars, Tab Bars, modal sheets, the toolbar. Flat paper everywhere else. **No drop shadows on content.**

Apple's **UIBlurEffect** / **.regularMaterial** handles the math. We just label them and put our type and tint on top.

The four materials we use

Ultra Thin .ULTRATHINMATERIAL 01ULTRA THIN	Thin .THINMATERIAL 02THIN	Regular .REGULARMATERIAL 03REGULAR	Thick .THICKMATERIAL 04THICK
--	---	--	--

Where each lives

SURFACE	MATERIAL	WHY
Nav Bar (scrolling)	.regularMaterial	Reads as paper while content slides under it.
Tab Bar	.regularMaterial	Same material as Nav Bar so the screen feels framed.
Search bar (active)	.thinMaterial	Lets the list peek through during query.
Floating toolbar / pen tray	.thickMaterial	Heavier — reads as a tool resting on the page.
Sheet handle area	.regularMaterial	System-supplied; we don't override.
Note cards (in lists)	– (flat surface)	Content surfaces are flat ink-on-paper.

Elevation — there isn't much

The brand is **e-ink, not glass**. Avoid drop shadows on content cards. Use the OS-supplied shadow on modal sheets and popovers, and a single hairline rule everywhere else.

LEVEL	TREATMENT	USE
0 – On paper	flat, hairline rule	List rows, note cards, editor
1 – Floating	material + 1 px ink/8% rule	Toolbars, tag pills, floating menus
2 – Sheet	system shadow (don't override)	Modal sheets, share sheet, popovers
3 – Alert	system shadow + system blur	Alerts, action sheets – Apple owns these

Spacing & radii

SPACING – MULTIPLES OF 4

22 PT
44 PT
88 PT
1212 PT
1616 PT
2424 PT
3232 PT
4848 PT

CORNER RADII – MATCH APPLE'S

0	6	10
HAIRLINE RULE	BUTTONS, CHIPS	LIST ROWS, POPOVER
14	22%	
SHEETS, ALERTS	APP ICON (CONTINUOUS)	

We default to **0** on content surfaces — the brand is hairline-ruled. We use Apple's continuous corner radii on chrome (**10/14/22%**) so our app feels native at the edges.

05 — ICONOGRAPHY

SF Symbols only.

Every glyph in the app is an **SF Symbol**. They ship with the OS, scale with Dynamic Type, and tint with our ink. **No custom monoline icon set.**

We render all symbols at **weight: .regular** on paper and **weight: .medium** when they sit alone on a Tab Bar. The marketing kit's monoline set was a tribute to SF Symbols anyway — going native costs us nothing.

Inventory — 32 symbols, app-wide

					
clock	calendar	alarm	sun.max	moon	cloud
					
person	doc	folder	bookmark	star	bookmark.fill
					
plus	minus	xmark	checkmark	checkmark.circle	circle
					
sidebar.left	line.3.horizontal	ellipsis	square.and.arrow.down	square.and.arrow.up	trash

Sizing & weight

CONTEXT	SIZE	WEIGHT	COLOR
Tab Bar	.medium · 25 pt	.medium	ink (active) / ink-3 (inactive)
Nav Bar trailing	.body · 17 pt	.regular	app tint (= ink)
List row leading	.body · 17 pt	.regular	ink-2
Toolbar / pen tray	.title2 · 22 pt	.regular	ink (active) / ink-2 (inactive)
Inline metadata	.footnote · 13 pt	.regular	ink-2

Always set `.symbolRenderingMode(.monochrome)` and tint via `.foregroundColor(.tint)`. Multicolor and hierarchical modes pull the symbol away from our ink line.

Stock,
tinted.

Use UIKit / SwiftUI controls. Tint them ink, set the corner radius to match Apple's continuous radii, and let the OS animate them. **Custom only where we can get away with it** — Nav Bar titles, the editor toolbar, the pen tray.

The system, applied.

The app is an iPad-first canvas. Four reference surfaces — **Home**, the **Notebook editor**, and two of its modals — with every token, type, material, and SF Symbol from the preceding pages in play. They are the brief for any new in-app surface; the rest of the kit defends them.

What's different from marketing: no Editorial New, no Caveat, no paper-cream background asserted on every chrome. The brand earns its presence inside a few *editorial anchors* — a New York date masthead, a serif headline row, the monogram in a sidebar — and steps aside everywhere else so iPadOS can do what it does.

Home — Daily Brief reimaged

The current home page leans on a hard “Daily Brief” card with a paragraph of summary. We replace that paragraph with a **masthead**: New York date, mono synced-time line, and a single serif sentence. Counts (events, reminders, birthdays) sit as numerals along the rule — the way a newspaper's standfirst would. **Details** still opens the existing sheet for the long form.

Below the masthead, the notebook grid trades the bold white book icons for **spine cards** — a tall paper rectangle with a single vertical rule and the title in New York. Less “app icon,” more “spine on a shelf.” New, search, and account stay in their system-stock positions.

- **Tokens:** canvas → Surface/Paper; nav chrome → `.regularMaterial`; rule → `--rule`.
- **Type:** serif date masthead → New York 56–64; brief sentence → New York 22; metadata → SF Mono 11 caps.
- **Symbols:** `square.and.pencil`, `magnifyingglass`, `bell`, `person.crop.circle`.

Notebook editor — left rail, paper canvas

The editor keeps its **vertical tool rail** on the left — the most app-specific bit of UI we own and the only place we accept a custom control surface. The rail is **—surface** with **0.5px** hairline rules and uses **SF Symbols only**. The active tool is ink-filled; everything else is stroke-only at SF Symbols 1.6.

The canvas is paper-cream (#FAF8F8), full bleed. Templates (Wide, College, Narrow, Grid, Dots, Iso) draw their rules in **—ink** at 6–12% opacity. The floating brief button (top-left, dot-fill) is the editor's only piece of brand chrome — a quiet way back to *Today*.

Top right: the system close affordance. Bottom right: a curl gesture target for page navigation — a deliberate quotation of the marketing site's masthead curl.

Editor modals — Pen, Template, Headers, Task Brief

Anchor checklist — every screen carries one

01 — THE MASTHEAD

Day-of-week in **New York 56–64**, italic month abbreviation in `--ink-2`. One per top-level screen, never inside a sheet.

02 — THE MONO CAPTION

SF Mono **10–11 px**, 0.18 em letter-spacing, all caps. Used for time stamps, counts, sync status, sheet titles.

03 — THE HAIRLINE RULE

1 px in `--rule`. The brand's structural element — sets editorial rhythm without asking for color.

Where Apple owns it.

When EventKit asks for calendar access, when ShareSheet appears, when the Photos picker comes up — these are **Apple's surfaces**, not ours. They use system blue, system materials, system fonts. We **cannot** brand them and shouldn't try.

Our job is to make the hand-off clean: a branded screen leads into the system surface, and the system surface returns to a branded screen. The brand **frames** the system moment.

Surfaces we don't own

SURFACE	OWNER	WHAT WE CONTROL
EKEventEditViewController	EventKit	Tint color (= ink). Title, dismissal, presenting screen.
UIActivityViewController (Share)	UIKit	applicationActivities array, excludedActivityTypes, completion handler.
PHPickerViewController (Photos)	PhotoKit	Filter, selection limit, preferred assetRepresentation.
UIDocumentPickerViewController	UIKit	Allowed content types, multi-select, starting directory.
CNContactPickerViewController	Contacts	Predicates, allowed properties.
SFSafariViewController	Safari	preferredBarTintColor, preferredControlTintColor, dismiss style.
System alerts	UIKit	Title, message, actions. Visuals are locked.
Permission prompts	OS	Usage description string in Info.plist.
Dictation / keyboard	OS	keyboardAppearance (light/dark), inputAccessoryView.
Quick Look	QuickLook	Source items only.

Hand-off pattern

BEFORE — BRANDED

Add to your calendar.

A clean lead-in row in our type, our material, our tint.

Continue in Calendar

DURING — APPLE'S UI

New Event

EKEventEditViewController. System fonts, system blue accents — we tint to ink, that's it.

CancelAdd

AFTER — BRANDED

Saved to *Calendar*.

Confirmation in our type, on our paper. Receipts back to brand.

TUE · MAY 7 · 11:30

Quiet,
literate,
brief.

The marketing voice is editorial — full sentences, ledes, the occasional em-dash flourish. **In-app copy is shorter:** a list row label, a button, a confirmation. Same warmth, less breath.

Six rules for in-app copy.
The serif is the singer. The
sans is the speaker. The
mono is the postmark.

01 Lower-case unless it's a proper noun. Tab Bar labels, button copy, list metadata — all sentence-case. Reserve Title Case for screen titles and product names.	02 Numbers in figures, never spelled. 4 events · 3 due · 1 birthday — not "four events". Tabular figures via <code>font-feature-settings: 'tnum'</code>.
03 Em-dashes earn their place. Use them in editorial moments — date masthead, daily brief, empty states. Not in list rows, not in errors, not in buttons.	04 Confirmations are quiet. "Saved." not "Successfully saved!" — never an exclamation, never a redundant adverb. The brand confirms by appearing, not by celebrating.
05 Empty states have a sentence. Not "Nothing here yet." Try: <i>"Nothing yet — your first note is one tap away."</i> The serif gets a moment; the CTA is a real button.	06 Apple's voice is fine where Apple speaks. System alerts ("Allow access to Calendar?") use Apple's wording. Don't try to ghost-write the OS — the user knows the difference.

Stop signs.

The marketing kit can break its own rules for a magazine spread. The app can't — it ships in millions of pockets and any drift compounds. **These are the boundaries.**

DO — LET THE OS SUPPLY CHROME

< Notebooks

Notebook A

⋮

UINavigationController with .regularMaterial, app-tint controls, serif title. Ours, but native.

DON'T — RE-STYLE WHAT USERS EXPECT

◀ ink ▶ a / B

⌘ ≡

A black, serif-only bar with idiosyncratic glyphs. Beautiful in the brand kit; unreadable in a Tab Bar. Don't ship it.

DO — TINT EVERYTHING TO INK

Save

Tag

Cancel

App tint = ink. All UIKit / SwiftUI controls inherit. **System blue stays only inside Apple's surfaces.**

DON'T — LEAVE SYSTEMBLUE IN OUR CHROME

Save

Tag

Cancel

It's the default and it ruins the line. Set window.tintColor at app launch and forget about it.

DO — ANCHOR SCREENS WITH ONE EDITORIAL MOMENT

TODAY

Tuesday, May 7.

A New York display title plus mono eyebrow tells you the brand without fighting the OS.

DON'T — SET EVERY LABEL IN THE SERIF

○ Reply to Ana

due

○ Pick up parcel

due

Italic serif at list-row size is harder to scan and breaks Dynamic Type. Reserve serif for titles and the editor.

DO — QUOTE THE SYSTEM BACK TO ITSELF

"From Ink" Would Like to Access Your Calendar

So your daily brief can show today's events.

Don't Allow OK

Permission prompts are Apple-shaped. We supply the usage string, in our voice — short, useful, no marketing.

DON'T — REINVENT SYSTEM GESTURES

"Pinch with three fingers and rotate to archive."

Cute in the brand video. A bug report in real life.

Swipe-to-delete, pull-to-refresh, edge-back, drag-to-reorder — use the system gestures. They have a decade of muscle memory behind them.
